

## Machine Learning Exercise Sheet 3

### Probabilistic Inference

---

Exercise sheets consist of two parts: homework and in-class exercises. You solve the homework exercises on your own or with your registered group and upload it to Moodle for a possible grade bonus. The in-class exercises will be solved and discussed during the tutorial along with some difficult and/or important homework exercises. You do not have to upload any solutions of the in-class exercises.

---

#### In-class Exercises

Consider the probabilistic model

$$p(\mu \mid \alpha) = \mathcal{N}(\mu \mid 0, \alpha^{-1}) = \sqrt{\frac{\alpha}{2\pi}} \exp\left(-\frac{\alpha}{2}\mu^2\right)$$
$$p(x \mid \mu) = \mathcal{N}(x \mid \mu, 1) = \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{1}{2}(x - \mu)^2\right)$$

and a set of observations  $\mathcal{D} = \{x_1, \dots, x_N\}$  consisting of  $N$  samples  $x_i \in \mathbb{R}$ .

*Note:* We parametrize  $\mu \mid \alpha$  with the *precision* parameter  $\alpha = 1/\sigma^2$  instead of the usual variance  $\sigma^2$  because it leads to a nicer solution.

**Problem 1:** Derive the maximum likelihood estimate  $\mu_{\text{MLE}}$ . Show your work.

**Problem 2:** Derive the maximum a posteriori estimate  $\mu_{\text{MAP}}$ . Show your work.

**Problem 3:** Does there exist a prior distribution over  $\mu$  such that  $\mu_{\text{MLE}} = \mu_{\text{MAP}}$ ? Justify your answer.

**Problem 4:** Derive the posterior distribution  $p(\mu \mid \mathcal{D}, \alpha)$ . Show your work.

**Problem 5:** Derive the posterior predictive distribution  $p(x_{\text{new}} \mid \mathcal{D}, \alpha)$ . Show your work.

## Homework

### Optimizing Likelihoods: Monotonic Transforms

Usually we maximize the *log-likelihood*,  $\log p(x_1, \dots, x_n \mid \theta)$  instead of the likelihood. The next two problems provide a justification for this.

In the lecture, we encountered the likelihood maximization problem

$$\arg \max_{\theta \in [0,1]} \theta^t (1 - \theta)^h,$$

where  $t$  and  $h$  denoted the number of tails and heads in a sequence of coin tosses, respectively.

**Problem 6:** Compute the first and second derivative of this likelihood w.r.t.  $\theta$ . Then compute first and second derivative of the log-likelihood  $\log \theta^t (1 - \theta)^h$ .

**Problem 7:** Show that every local maximum of  $\log f(\theta)$  is also a local maximum of the differentiable, positive function  $f(\theta)$ . Considering this and the previous exercise, what is your conclusion?

### Properties of MLE and MAP

**Problem 8:** Consider a Bernoulli random variable  $X$  and suppose we have observed  $m$  occurrences of  $X = 1$  and  $l$  occurrences of  $X = 0$  in a sequence of  $N = m + l$  Bernoulli experiments. We are only interested in the number of occurrences of  $X = 1$ —we will model this with a Binomial distribution with parameter  $\theta$ . A prior distribution for  $\theta$  is given by the Beta distribution with parameters  $a, b$ . Show that the posterior *mean* value  $\mathbb{E}[\theta \mid \mathcal{D}]$  (not the MAP estimate) of  $\theta$  lies between the prior mean of  $\theta$  and the maximum likelihood estimate for  $\theta$ .

To do this, show that the posterior mean can be written as  $\lambda$  times the prior mean plus  $(1 - \lambda)$  times the maximum likelihood estimate, with  $0 \leq \lambda \leq 1$ . This illustrates the concept of the posterior mean being a compromise between the prior distribution and the maximum likelihood solution.

The probability mass function of the Binomial distribution for some  $m \in \{0, 1, \dots, N\}$  is

$$p(x = m \mid N, \theta) = \binom{N}{m} \theta^m (1 - \theta)^{N-m}.$$

*Hint:* Identify the posterior distribution. You may then look up the mean rather than computing it.

**Problem 9:** Consider the following probabilistic model

$$p(\lambda \mid a, b) = \text{Gamma}(\lambda \mid a, b) = \frac{b^a}{\Gamma(a)} \lambda^{a-1} \exp(-b\lambda)$$

$$p(x \mid \lambda) = \text{Poisson}(x \mid \lambda) = \frac{\lambda^x \exp(-\lambda)}{x!}$$

where  $a \in (1, \infty)$  and  $b \in (0, \infty)$ . We have observed a single data point  $x \in \mathbb{N}$ . Derive the maximum a posteriori (MAP) estimate of the parameter  $\lambda$  for the above probabilistic model. Show your work.

## Programming Task

**Problem 10:** Download the notebook `exercise_03_notebook.ipynb` from Moodle. Fill in the missing code and follow the instructions in the notebook to append the solution to your PDF submission.

*Note: We suggest that you use Anaconda for installing Python and Jupyter, as well as for managing packages. We recommend that you use Python 3.*

*For more information on Jupyter notebooks, consult the Jupyter documentation. Instructions for converting the Jupyter notebooks to PDF are provided within the notebook.*
